

Kahuna Inc Project

Please find the localhost configuration I used for my project as per below. Also I have added a screenshot displaying the xampp control panel and the ports being used for the Apache server and MySQL.

Virtual host apache configuration on localhost

```
44 <VirtualHost *:80>
45     DocumentRoot "C:/xampp/htdocs/kahuna-api"
46     ServerName kahuna-api.localhost
47
48     <Directory "C:/xampp/htdocs/kahuna-api">
49         Require all granted
50         AllowOverride All
51     </Directory>
52 </VirtualHost>
53
54 <VirtualHost *:80>
55     DocumentRoot "C:/xampp/htdocs/kahuna-client"
56     ServerName kahuna-client.localhost
57
58     <Directory "C:/xampp/htdocs/kahuna-api/kahuna-client">
59         Require all granted
60         AllowOverride All
61     </Directory>
62 </VirtualHost>
63
64
```

Xampp Control Panel

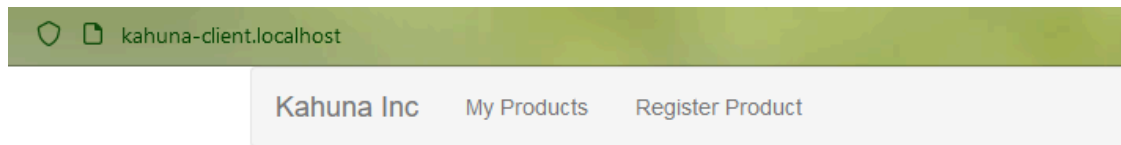

The Kahuna client uses Altoroter for routing. The route that takes you to the homepage is '/'.

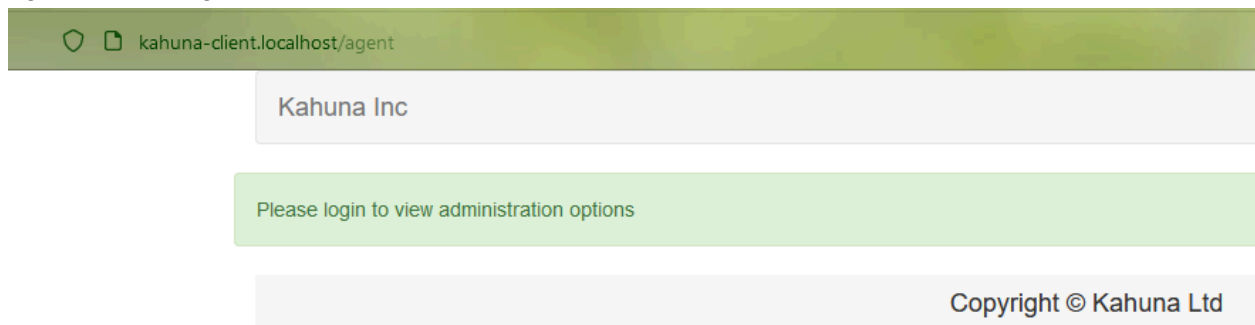

The Kahuna Agent Administration homepage is to be accessed on the route '/agent'. (If on the agent homepage there is already session that holds customer session information, kindly delete it in order for the new session to hold the right agent information as I still needs to fix this)

Password (Agents & customers): **pass**

Customer Homepage

Agent Homepage

Thanks
